

Installation instructions

- The course content was written in Python 3.12 in the VSCode editor
- You can find the course contents under `../suschemsys` in the Jupyter Notebook-files (.ipynb)
- The notebooks can be run locally wither on your machine and on Google colab (requires login with your google account). Instructions below.

Local machine

In this [video](#) you can find everything you need for installing Python, the editor and the package manager Anaconda (`conda`). Our coding example requires several python modules that we need to install. We use `conda` to create a virtual environment for the course with the name `suschemsys` .

On your local machine, open your terminal and create a new conda environment from the .yml-file

Then we simply need to activate the environment:

Great! Now everything is ready on your local machine! :+1:

Google colab

In google colab, we need to clone the repo and install everything via pip. Just run this cell:
